

My Impact

By: Ananya

Summary of My Generation Green project

My project was a two part project. The first part was to change all the 60 watt incandescent light bulbs to 12 watt LED light bulbs. The second part was to try to reduce the time that I used light bulbs in my house. My project was a simple and efficient project. I changed all the incandescent bulbs to LED. I used them all for about an average of 4.5 hours in a day, with the total coming to 94 hours out of the 504 hours in 21 days, with the 60 watt bulbs. I used the 12 watt LED bulbs for about an average of 4 hours in a day with the total coming to 83 hours out of the 504 hours in 21 days. I made a total impact of 92.88. That may not be a big number but it does make a small difference.

I would like to thank the Halton Climate Collective for giving me the opportunity to do a project like this, and thinking I could make a change.
